General tyre information

All tyres fitted by Porsche meet Porsche specifications, as indicated by the special designation (N0, N1, etc.) on the sidewall. Tyres that do not carry this designation are not recommended for use on your Porsche. For logistical and technical reasons relating to the production process, we are unable to accept orders for a particular make of tyre. The make of tyre may differ from that shown. If your vehicle documents do not contain details of the correct wheel and tyre combination, please request a technical approval certificate from your Porsche Centre.

Note on the use of winter tyres

Summer tyres provide optimum performance at ambient temperatures above approx. +7°C. Below this point, the tyre compound begins to harden and braking distances are increased. We therefore recommend that you fit winter tyres during the colder months of the year so that you can drive your vehicle safe in the knowledge that it will continue to meet our high standards for driving safety, even at low temperatures. All winter tyres approved by Porsche are identified by an 'N' designation on the sidewall.

Additional benefits: the tyres are noise-optimised. There is also less rolling resistance, which helps reduce fuel consumption.

Tyre braking behaviour for all models:

The average CO<sub>2</sub> emissions value of all new vehicles sold in Switzerland is 137g/km.

1) Data determined in accordance with the measurement method required by law. Since 01 September 2017 certain new cars have been type approved in accordance with the Worldwide Harmonised Light Vehicles Test Procedure (WLTP), a more realistic test procedure to measure fuel/ electricity consumption and CO<sub>2</sub> emissions. From 01 September 2018, the WLTP replaced the New European Driving Cycle (NEDC). Due to the more realistic test conditions, the fuel/electricity consumption and CO<sub>2</sub> emission values determined in accordance with the WLTP will, in many cases, be higher than those determined in accordance with the NEDC. This may lead to corresponding changes in vehicle taxation from 01 September 2018. You can find more information on the difference between WLTP and NEDC at [www.porsche.com/wltp](http://www.porsche.com/wltp) Currently, we are still obliged to provide the NEDC values, irrespective of the testing method used. The additional reporting of the WLTP values is voluntary until their obligatory use. As far as new cars (which are type approved in accordance with the WLTP) are concerned, the NEDC values will therefore be derived from the WLTP values during the transition period. To the extent that NEDC values are given as ranges, these do not relate to a single, individual car and do not constitute part of the offer. They are intended solely as a means of comparing different types of vehicle. Extra features and accessories (attachments, tyre formats, etc.) can change relevant vehicle parameters such as weight, rolling resistance and aerodynamics and, in addition to weather and traffic conditions, as well as individual handling, can affect the fuel/electricity consumption, CO<sub>2</sub> emissions and performance values of a car.

2) Guide value determined using a WLTP subcycle (including taking account of auxiliary equipment, such as air conditioning).

3) Valid in the countries listed only.
